

# Stream et JPA

L'utilisation des streams est pratique en JPA pour rajouter du filtrage sur des entité qui reviennent de la base.

```
@Transactional(readOnly = true)
public List<Employe> processEmploye(String email) {
    Stream<Employe> employeStream = bookRepository.getAll();
    return
        employeStream .filter(employe -> {
            □
            boolean result= employe.getEmail().contains(email);
            entityManager.detach(employe);
            return result;
        }
    )
    .collect(Collectors.toList());
}
```
